

# Consultancy - Physical Risk Assessment

## Scenario

An explosion occurs at a chemical plant located within the same business park as your organisation. Local news media are reporting that an undetermined number of the company's employees have been injured and officials are trying to determine to what extent deadly toxins have been released into the air. An evacuation of the entire business park has been ordered. No-one is sure what caused the incident, or whether it is safe for occupants of the business park to return to their primary sites to continue critical operations. What would you do?

OpsCentre's Physical Risk Evaluation service provides you with an assessment of your organisation's premises safety, security and systems infrastructure as well as neighbouring and locational risks to ensure you are well aware of both the internal and external risks to which your organisation may be exposed.

## Approach

Our **Physical Risk Evaluation**

**Consultancy** service, developed over considerable years of client projects and experience, assesses all types of environmental and physical space, including:

- Computer Rooms/Data Centres;
- Operations/Control Centers;
- Maintenance Facilities;
- Call/Contact Centers;
- General office areas
- Areas of buildings which are not occupied by the tenant (gallery and reception areas, car parks, basements, retail outlets).

## Deliverables

**Physical Risk Review.** We provide a management report incorporating key findings, a summary of physical risks, threats and your vulnerability to them, our recommendations and a plan for remedial actions. Costs for implementation can also be provided.

## OPRA Software

**OpsCentre Physical Risk Analysis.**

OpsCentre also provides a software-based solution to assist Corporate Facilities Managers to define and measure the security and risk standards for multiple sites and premises. Our tool tracks and records incidents at each site, provides a view of the facilities, security and risk metrics that you have defined at a global, country, state, street and individual site level.

Risk metrics and weightings are applied and assessed at the component level within each site; e.g. to security cameras or fire fighting equipment; allowing an inventory of standards equipment for facilities management purposes to be tracked. The package is fully integrated with Google Maps and Images and as you would expect, available online with 24x7 access.

For more details about these solutions, contact us on **1300-BCPLAN** or **email us**.
